VAN

BLUEPRINTS

Van Blueprints

Intro

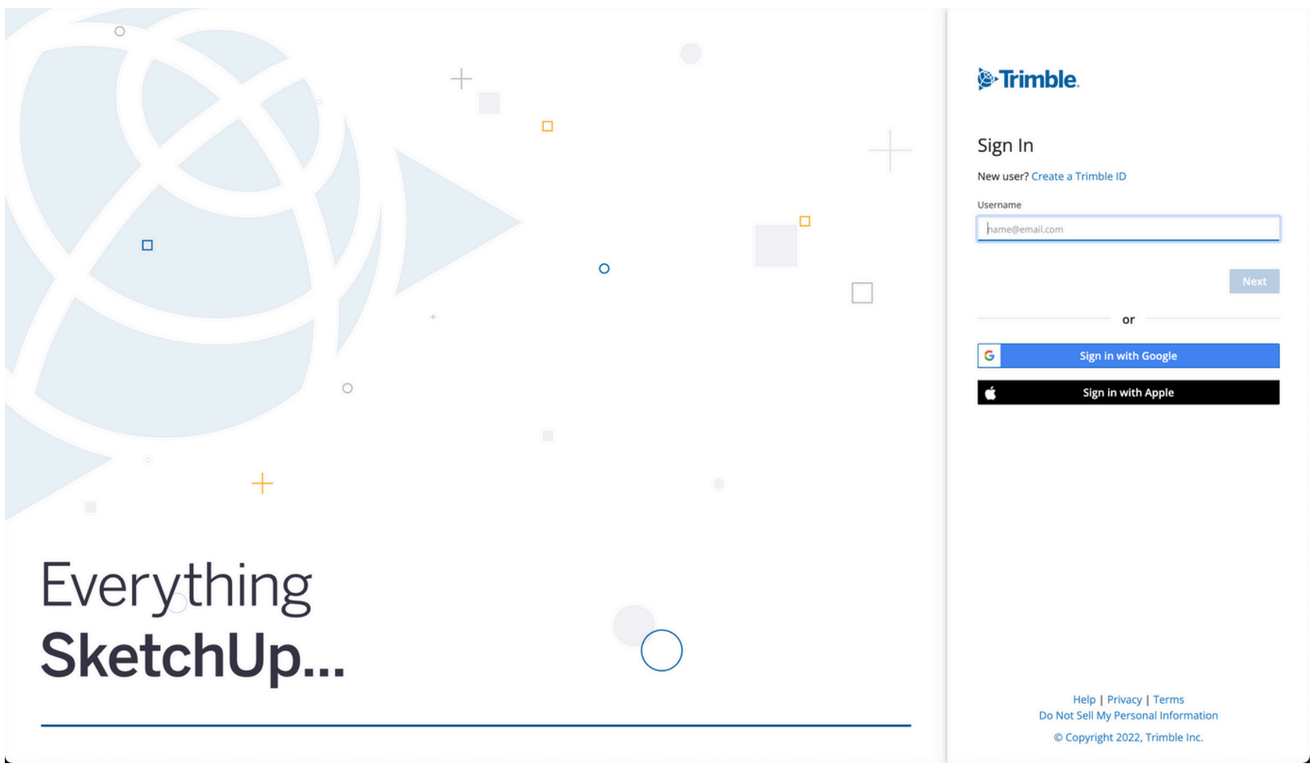
Thank you for checking out my Van Build Blueprints! I hope you find it useful in your van build and inspires you to think outside the box of conventional van design.

How To Use

The attached file is a Google Sketchup File (.skp) that you can import into any version of Sketchup. Once the model is in Sketchup you're free to do whatever you want with it! Whether that be simply taking measurements of all the major components, or changing and modifying it to better suit your needs.

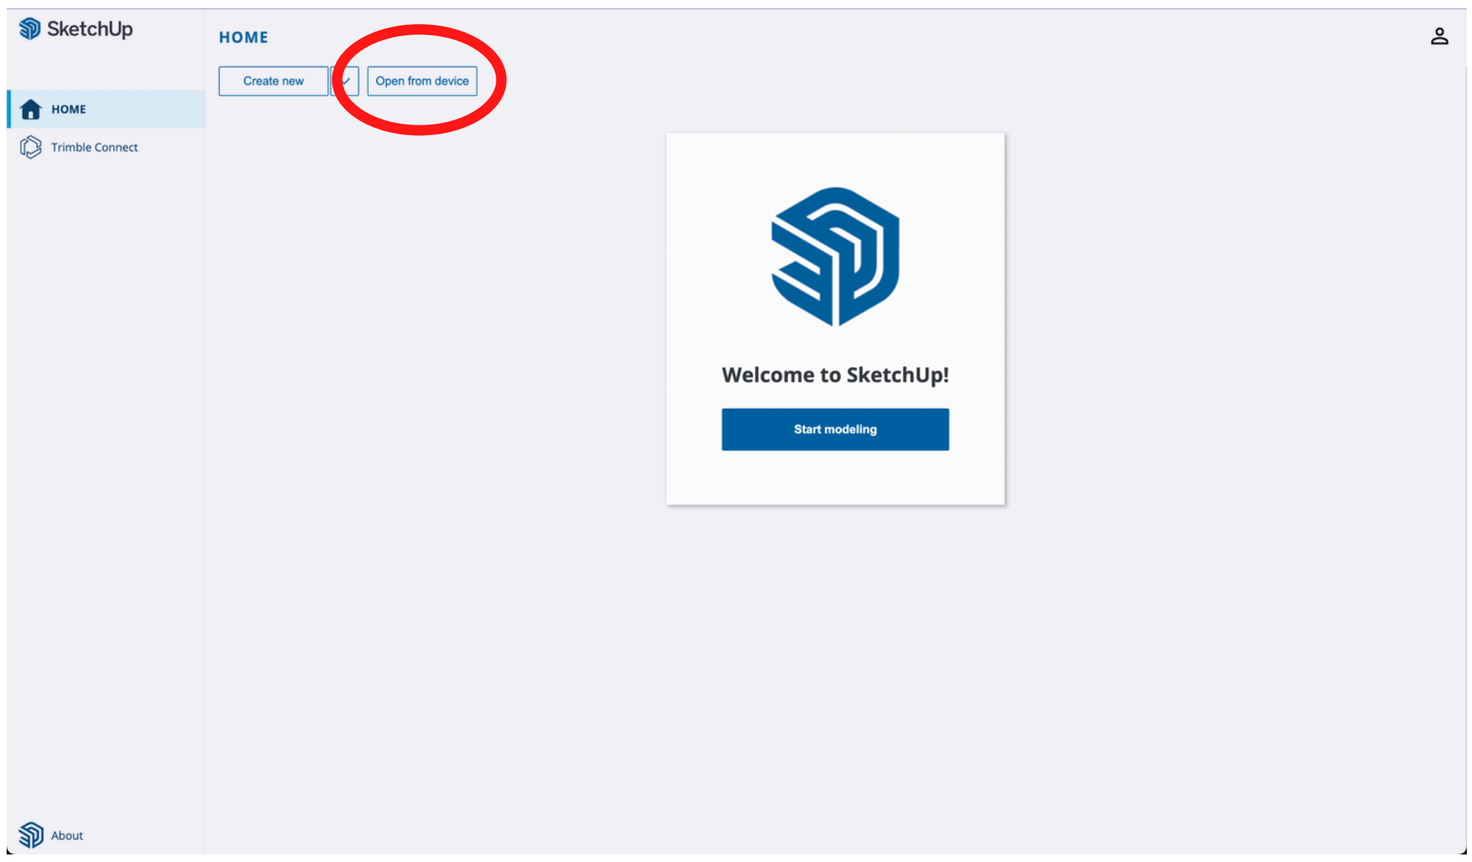
To import the file into Sketchup you'll first need an account. Simply go to the following URL and you'll be directed to create a new Trimble account (or you can just login with Google)

https://app.sketchup.com/app?hl=en

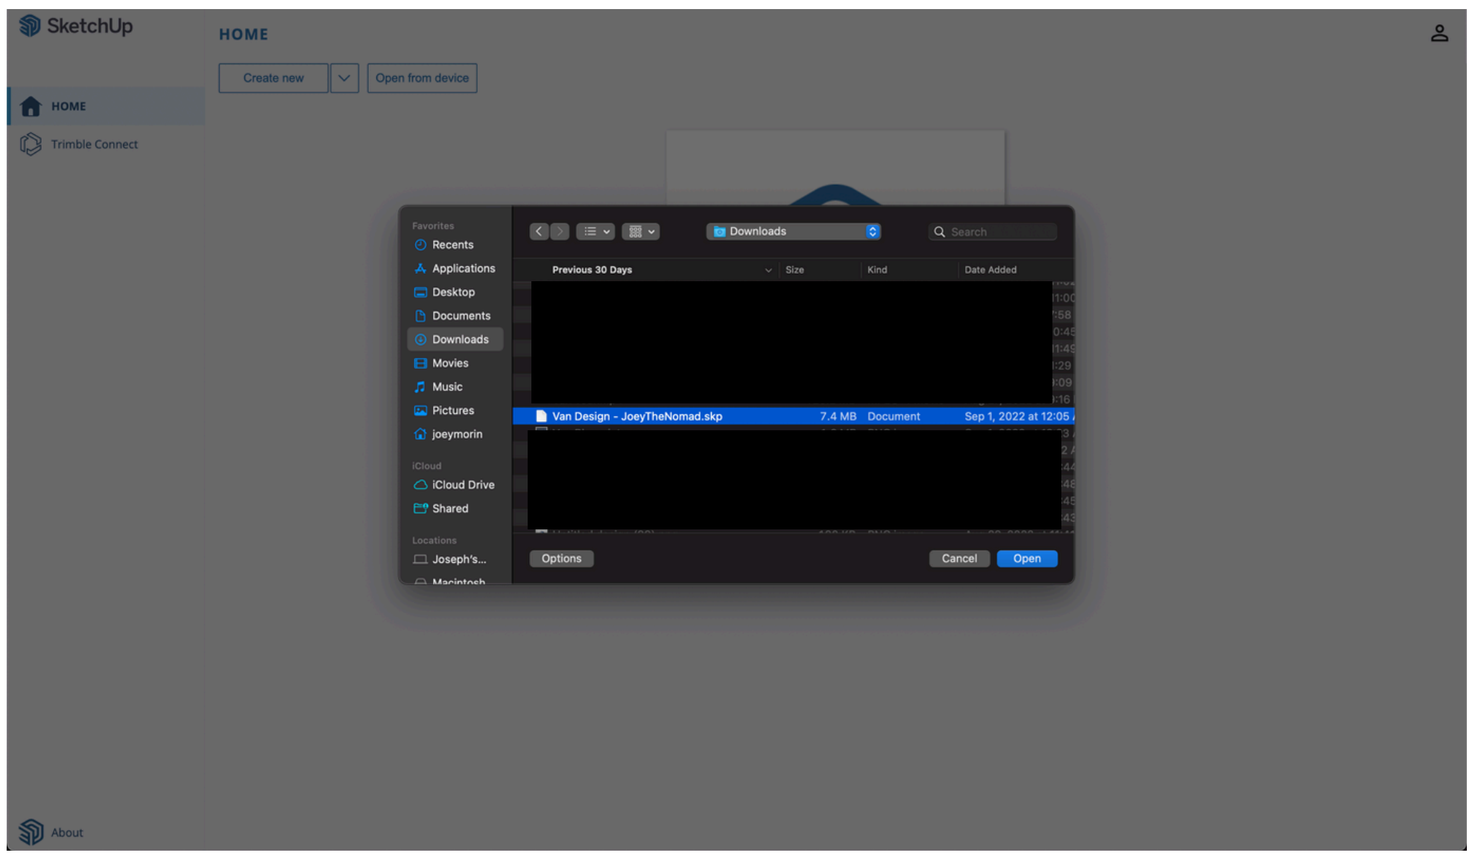


Van Blueprints

Once you create an account or login you'll be redirected to the main home screen where you can create a new model or upload one from your computer. We're going to select "Open from device".



Navigate to wherever you downloaded the "Van Design - JoeyTheNomad.skp" file (likely in your Downloads folder) and click open.



You may get a pop-up that says "You've selected a large model which may slow down SketchUp or cause other issues", just ignore it and click "Open".

The file should then open and look like this:

And thats it! You can now edit and do whatever you want to the Van Model.

Keep in mind this model was designed to fill the cargo space of a 159" wheelbase non-extended RAM Promaster cargo van, so you may need to adjust any measurements if you have a different van.

If you're not familiar with how to use Sketchup I recommend checking out some free online tutorials like the one below before you get started.
